FIRELINK

Platform user guide

Roles, workspaces and daily tasks - admin, vendor and customer

FireLink brings fire-safety products, services, compliance and vendors into one platform, with a separate workspace for every role: customer, organization admin, vendor and vendor admin, technician, engineer, platform admin and super admin. This guide explains, step by step, what each role sees and does - so a new user can be productive on day one.

Where to open it

https://firelinkpo.base44.app

Everyone signs in at the same address - or your organisation's custom domain - and sees only their own workspace.

What is inside

1. Start here - the eight roles (everyone)
2. Customer - buying, services and compliance
3. Organization admin - sites, assets and compliance
4. Vendor - selling, servicing and getting paid
5. Vendor team - vendor admin and staff sub-roles
6. Platform admin - running the marketplace
7. Super admin - the control room
8. Technician and engineer
9. What the platform does by itself
10. Quick answers
11. Getting help

1. Start here - the eight roles (everyone)

Browsing is open to everyone: the home page, products, services and the vendor directory can be viewed without an account. Anything that creates a record - ordering, booking, requesting a quote, raising a ticket - needs a signed-in account.

Create your account

1. Open the website and click Create account (Register).
2. Enter your email and password, then submit.
3. Enter the one-time code (OTP) sent to that email and verify.
4. You are signed in. Google sign-in also works where it is enabled.

The eight roles

- Customer - a buyer: orders, services, own assets and compliance.
- Organization Admin - runs one organisation: sites, assets, compliance, purchases and users.
- Vendor / Vendor Admin - a seller: catalogue, quotations, orders, services and money.
- Technician - works on site: assigned jobs, asset QR scans, inspections.
- Engineer - fire load, hydraulic and BOQ calculations, engineering reports.
- Platform Admin - approves vendors and products and runs the marketplace.
- Super Admin - roles, feature flags, integrations, system health and revenue model.

Sign in and workspaces

- Sign in from the Login page. Forgot password emails you a reset link.
- After signing in you land in the workspace your account is allowed to use, and you only see the modules and records for that role.
- The role menu at the top right switches your workspace; it only offers platform admin and super admin to real administrators.
- Vendor staff see their own vendor only; a customer and an organisation admin see only their own organisation's data.
- Some accounts need a role assigned first - the platform administrator assigns it, or a vendor owner invites you as staff.

The 60-second tour

- Customer: Dashboard, Marketplace, Cart, Orders, RFQs, Quotations, Assets, QR Scanner, Certificates, Compliance, Services, AMC, Fire Audit.
- Organization admin: Org Dashboard, Sites, Assets, Certificates, Fire NOC, Compliance Calendar, Compliance, CAPA, Maintenance, Reports.
- Vendor: Dashboard, Products, Inventory, RFQs, Quotations, Orders, Service Requests, Settlements, Team, Subscription.
- Platform team: Approvals, Orders, Disputes, Tickets, Categories, Commissions, Advertisements, Audit log.

2. Customer - buying, services and compliance

Buy a product

1. Open Marketplace and use search, category filters and sorting.
2. Open a product for price, stock, warranty, specifications and vendor details. Compare vendors side by side, or save it to your wishlist.
3. Set the quantity and add it to the cart. The cart keeps items from different vendors separate.
4. Open the cart and check out: delivery address, contact details, then place the order.
5. In Orders, open any order for line items, invoice and courier tracking.

Ask for quotes (bulk or custom requirement)

1. Open RFQs and describe what you need: product or category, quantity, delivery location and target date.
2. Vendors in that category send quotations with price, delivery time and validity.
3. Open Quotations to compare them and accept the one you want - it becomes an order.

Book a service

1. Open Services and pick a category: inspection, audit, NOC assistance, extinguisher refilling, alarm, hydrant or sprinkler, pump service.
2. Choose the service, book it for your site and add notes or a preferred date.
3. The vendor assigns a technician. You follow progress in Service Requests.
4. When the job closes, the report and any certificate appear in Documents and Certificates.

Everything else in the customer portal

- Dashboard: orders, assets, certificates expiring soon and open requests in one view.
- My Assets: your own equipment with QR scanning and asset history. AMC Plans and Fire Audit for service cover.
- Support: raise a ticket and track replies. Notifications shows order, service and compliance updates.
- AI assistant: ask fire-safety questions such as which extinguisher to use, refilling intervals or NOC rules.
- Jobs: apply to vendor vacancies. Compare Vendors: shortlist vendors before you buy.
- Profile and Settings: keep name, phone and organisation details current - invoices and reports use them.

3. Organization admin - sites, assets and compliance

The organization admin owns everything for one organisation: its sites, its assets, its compliance record, its purchases and its users. This is the role an EHS, safety or facilities head uses.

Set up the organisation

1. Keep the organisation profile current - name, GST number, contact person and address. It appears on orders, certificates and reports.
2. Add each Site with its address, buildings and floors. Assets, certificates and compliance stay grouped by site.
3. Invite your colleagues under Users and give each one the right role, so everyone works inside the same organisation's data.

Register and track assets

1. Open Assets and add each item - extinguisher, alarm panel, hydrant, pump, system - with type, location (site, building, floor, zone), installation date and photos.
2. Import in bulk for a large site list, or assign assets to a site or a person.
3. Every asset gets a QR tag. Print it, stick it on the asset, and scan it to open the full history - inspections, certificates and status.

Run compliance

- Certificates: record and upload every certificate with its expiry date, and download it whenever an auditor asks.
- Fire NOC: keep the NOC number, issuing authority, issue and expiry date with the file.
- Compliance: the organisation-wide view of what is valid, expiring soon or expired.
- Compliance Calendar: month-wise view of renewals and inspections falling due.
- Maintenance: track maintenance and AMC activity across sites.
- CAPA: raise a corrective or preventive action for every gap found, assign an owner and target date, and close it only after verification.
- Reports: compliance and asset reports for management or for an inspector.

Buy for the organisation

- RFQs: raise bulk requirements, compare vendor quotations and generate a purchase order from the approved quote.
- Orders: review and approve purchases for the organisation and follow delivery.
- AI Assistant: fire-safety and compliance questions answered with your own site context.
- Documents: the organisation's drawings, datasheets, reports and NOC files in one place.

> A customer account buys for one person. An organization admin account buys and reports for a whole organisation, with the user, site and CAPA controls that come with it.

4. Vendor - selling, servicing and getting paid

Get set up

1. Register as a vendor, then sign in from the vendor login.
2. Complete Verification: upload GST, licences and certifications. The platform team reviews them and marks you verified.
3. Fill your Company profile: brand, address, categories, service areas and logo.

List your catalogue

1. Products: add each product with category, brand, unit, prices (B2B, B2C, MRP), MOQ, stock, warranty, key specifications, images and datasheet.
2. Submit it for approval. New products stay in draft or pending until the platform team approves them - only approved products appear in the public marketplace.
3. Inventory and Warehouses: keep stock per warehouse accurate so availability and delivery promises stay honest.
4. Services and AMC plans: list what you deliver with price, duration and coverage, plus annual maintenance plans.
5. Offers: run discounts and bundles for a set period.

Win the work

1. RFQs shows live customer requirements in your categories.
2. Send a quotation with price, delivery time and validity. Customers compare quotations side by side, so add your best terms.
3. When the customer accepts a quotation it becomes an order.

Fulfil and service

1. Orders: accept, then mark packed, then dispatched with courier and tracking number, then delivered. The customer follows the same status.
2. Returns: handle return or replacement requests and keep the reason recorded.
3. Service requests: assign a technician, schedule the visit and close the job with the report.
4. Technicians: keep your team listed with skills and certifications so assignments are accurate.
5. Certificates: issue certificates with your digital signature. Each one carries a QR code, so anyone can verify it is genuine.

Documents - when the platform team asks for a paper

1. Open Documents and click Upload Document.
2. Choose the document type - GST certificate, PAN, company registration, address proof, bank proof, signatory ID, MSME, ISO, product or fire-safety certification, contract, invoice or report.
3. Add an expiry date if the document has one, then upload the file (PDF, JPG or PNG). Files are stored privately.
4. Save the document. It appears in your vault with its status, and the platform team can open the same file for review.
5. Use the eye icon to open a document anytime, and the bin icon to remove one you no longer need.

Money and growth

- Payments: payment status for every order in one place.

- Settlements: each settlement shows gross sales, commission, net payable and status. Net payable = gross minus commission.
- Wallet: balance and transaction history.
- Subscription: choose a plan (for example Free, Silver or Gold). Higher plans allow more products and services and get search priority.
- Analytics: views, orders, revenue and your best-selling products.
- Customers: the buyers who ordered from you, with their order history.
- Job vacancies: post openings for your team; posts go live after the platform team approves them.

5. Vendor team - vendor admin and staff sub-roles

The vendor owner account (vendor admin) sees the full portal, including Settlements and Team. From Team, the owner invites staff and gives each person a sub-role. Staff see only their own vendor's records, and only the modules their sub-role allows.

- VENDOR_ADMIN - full vendor control, including team and finances.
- SALES_MANAGER - RFQs, quotations, orders and customers.
- PRODUCT_MANAGER - products and catalogue.
- INVENTORY_MANAGER - stock and warehouses.
- ORDER_MANAGER - order processing, dispatch and returns.
- SERVICE_MANAGER - service requests, technicians and schedules.
- FINANCE_USER - payments, settlements and wallet.
- VIEW_ONLY - can look, cannot change anything.

> If a staff member cannot see something, the sub-role is usually the reason. Fix it in Vendor - Team, and the change takes effect the next time they sign in.

6. Platform admin - running the marketplace

1. Dashboard: what needs attention today - pending vendor and product approvals, new orders, tickets and disputes.
2. Vendor approvals: read the submitted documents, then approve or reject with a reason. Approved vendors can sell.
3. Product approvals: check category, price, specifications and images, then approve, reject or disable. Only approved listings appear publicly.
4. Organizations and Customers: review accounts, plans, sites, users and compliance scores; suspend an account if needed.
5. Orders, Disputes and Tickets: monitor, step in, resolve or refund, and record the outcome.
6. Categories: keep the catalogue taxonomy clean so buyers can find products.
7. Commissions: set commission rates; settlements are calculated from them.
8. Payments: platform payment records per order.
9. Advertisements: approve or reject vendor creatives and placements (home, category, product page, sidebar, banner).
10. Job approvals: approve or reject vendor job posts.
11. Quotation monitoring: watch how RFQs convert to quotations and nudge slow vendors.
12. Certificate verification: check a certificate by number or QR and run spot audits.
13. Revenue model and Analytics: commission slabs and platform numbers - orders, revenue, vendors, categories.
14. Audit log: who changed what and when - the record used when something needs investigating.

7. Super admin - the control room

- Roles matrix (Roles and Permissions): decide which role can see and do what across the platform.
- System dashboard: platform-wide health and totals.
- Feature flags: switch modules on or off while rolling changes out.
- Integrations: connect payment, delivery, email and messaging providers.
- System health: background jobs and automations, including the daily compliance expiry check.
- Revenue model: subscription tiers, commission slabs and advertisement pricing.
- Also holds every platform admin power, plus delete and configure rights.

> Changes in this area affect every user on the platform. Keep at least one active super admin account at all times.

8. Technician and engineer

- Technician: your dashboard lists assigned jobs. Scan the asset QR on site, open the asset, complete the inspection checklist, attach photos and close the job. The customer's asset record and compliance status update from it.
- Engineer: use the fire load calculator, hydraulic calculator and BOQ generator for design work, and the AI assistant for fire-safety questions. Save and share engineering reports with the client.

9. What the platform does by itself

- Daily compliance check: certificates, NOC and maintenance that are expiring soon or already expired are flagged and the right people are notified.
- Order and RFQ notifications go to the vendor; status updates go to the customer.
- The contact form creates a support ticket, so no enquiry is lost.
- Every certificate QR opens a public verification page that confirms the certificate is genuine.
- Sensitive changes are written to the audit log.

10. Quick answers

A product is not visible on the website
It is still draft or pending. Submit it for approval - only approved products appear publicly.

Staff cannot see orders
Assign the right sub-role (ORDER_MANAGER for order work) in Vendor - Team.

A customer cannot order or book
Ordering and booking need a signed-in account. Browsing does not.

A colleague cannot see the organisation's sites
They need the Organization Admin role, assigned by the platform administrator.

Vendor documents are not verified
Re-upload clear documents in Verification; the platform team then approves the vendor.

A certificate shows expiring soon
Renew it and update the expiry date. The daily check recalculates the status.

An order is stuck in packed
Mark it dispatched with courier and tracking number so the customer can follow it.

A settlement looks lower than expected
Net payable is gross minus commission. Check the commission rate on the vendor or category.

11. Getting help

- Contact page: send a message - it becomes a ticket and is answered within one working day.
- Support portal: existing users raise and follow tickets from inside the app.
- Keep records current: organisation and vendor details, site list, asset QR tags and certificate dates. Clean records are what keep compliance clean.
